Clinically Proven treatment for fungal nails

Suitable for diabetics and children of 4 years and older.

### Mycosan Fungal Nail Treat + Camouflage contains:

- Mycosan Fungal Nail 5 ml (medical device)
- Nail polish 8 ml (cosmetic product)

Mycosan Treat + Camouflage has been specifically developed for the effective treatment of fungal nails and to immediately improve the appearance of the discoloured nail, when deemed necessary. Ideal solution for the effective treatment of fungal nails if you want to wear open shoes or flip flops.

### Indications for use

Mycosan Fungal Nail treatment treats fungal infections of the nail (*white superficial onychomycosis (WSO)* & *distal lateral subungual onychomycosis (DLSO)*) caused by fungi such as *T. rubrum*, *T. mentagrophytes* and *E. floccosum*. Onychomycosis is a fungal infection of the nails that causes discolouration, thickening, and separation from the nail bed. A fungal nail needs to be treated to prevent the fungal infection from spreading or worsening.

### Intended Purpose

Mycosan Fungal Nail treatment is intended to form a film on the nail that inhibits the growth of the fungi, involved in fungal infection, with the support of acidification.

### Why use Mycosan Fungal Nail Treat + Camouflage?

- ✓ **Mycosan serum:** proven effective against fungi, it stops the development of fungi causing fungal nails.
- ✓ **Precision Brush:** for the exact dosage on hard-to-reach areas.
- ✓ **10 nail files:** for better efficacy. Due to filing, the serum reaches the fungi better.
- ✓ **Natural Nail breathable nail polish:** instantly camouflages discolourations.
- ✓ **Suitable:** for diabetics and children of 4 years+.

### USE:

#### 1) ACTIVE TREATMENT:

##### finish the treatment for a successful result!

Before use, clean and dry the nails and where appropriate, remove all traces of nail polish.

Apply a small drop of serum twice a day for four weeks on the affected nail. A small drop is sufficient. Leave on to dry for one minute. After four weeks apply Mycosan Nail serum once a day until the affected area has grown out.

**ATTENTION!** Squeeze the tube gently.

#### 2) NATURAL NAIL POLISH

Apply once serum is completely dry. Apply when camouflage of discoloured fungal nail is desired. Repeat if necessary.

**ATTENTION!** This nail polish is not a treatment for fungal nail infections and is not a medical device.

#### 3) FILING IS IMPORTANT!

After treating the nail for one week, carefully file down excessive thickness of the affected area with accompanying nail files once a week. By filing the nail, the serum will penetrate the nail plate easier for optimal results.

**ATTENTION!** Use every nail file only once to prevent spread of infection.

### Mycosan Fungal Nail serum has a 3-fold effect:

#### 1. Effective

Its targeted action rapidly stops the development of the fungi that causes the fungal nail.

#### 2. Restores the nail

It penetrates the nail and improves its structure so that the natural state of the nail is repaired.

#### 3. Improves the appearance of the nail

It helps against discolouration of the nail.

### What is nail fungus?

Nail fungus or onychomycosis is a fungal nail infection occurring in the nail which causes its gradual destruction. It is characterised by the changing appearance of the nail, with the nail plate becoming thickened and yellow in colour and beginning to separate from the nail bed. Pain, especially during walking, may be experienced. Without treatment, the condition is likely to become worse and the infection may spread to other nails, the skin, or even contaminate other individuals.

### What can cause nail fungus?

Many factors promote the appearance of nail fungus: micro-traumas, wearing synthetic socks, narrow shoes, certain sports including swimming, hiking or marathon running and, generally speaking, all situations in which feet are prone to sweating, maceration, dampness and repeated shock. Nail fungus results from fungal contamination of the nail after prior infection of the skin, as for example in athlete's foot. In fact, when poorly treated or left entirely untreated, skin fungal infections can spread and cause nail fungus. It should be noted that certain individuals are more easily subject to fungal nail infection: diabetics, people suffering from blood circulation problems, and those with occupations requiring the wearing of safety shoes or boots, etc. If the problem persists, consult your doctor or pharmacist.

### How can you treat it?

When a nail is damaged by fungus, its repair process takes a long time in most cases. A toenail may take up to 6 or even 9 months to outgrow completely! It is therefore important to take action as soon as the nail begins to show the first signs of deterioration, and to continue use of Mycosan Nail as directed in this leaflet for successful treatment. Treatment of nail fungus consists first in inhibiting its development in the affected nail, and later in ensuring the growth of a healthy nail. At the same time, it is important to reduce all risk of contamination to surrounding nails.

Nail template to monitor progress

In order to monitor the progress of the nail, make a pencil note of the area affected by the fungus every month on the diagram below. This will help you measure the progress made. [FIG. 02 - nail template]

Mycosan Fungal Nail treatment schedule

- For a successful treatment, it is important to follow the treatment schedule consistently.
- Use the schedule below to keep track of your improvement.
- Even though improvement may not be so visible in the first month, this does not mean that the treatment is not working. Human nails grow slowly and it may take 6 to 9 months before the affected area is completely grown out. Treat the nail consistently and monitor your progress with the nail template. [FIG. 03 - treatment schedule]

Recommendations to optimise the efficacy of Mycosan Fungal Nail treatment kit

- Dry your hands and feet thoroughly after washing, also between fingers and toes.
- Cut nails short and avoid biting. Nail biting makes the nails more vulnerable to fungi.
- Opt for wearing absorbent socks to keep your feet fresh and dry. Change them regularly in case of high perspiration.
- Change shoes regularly and let them air out and dry well in between. Avoid wearing shoes made from synthetic materials.
- Choose well-fitting shoes that are not too narrow or too tight, allowing your feet to breathe.
- Always wear footwear in high-risk public places (changing rooms, pools, saunas etc.).
- Treat a fungal infection of the skin (e.g. athlete's foot) with an antifungal cream. With this type of infection, it is also recommended to treat socks and shoes with an antifungal powder and to use a separate towel.
